Abstract
In this contribution new chromosome data obtained from material collected in Italy are presented. It includes four chromosome counts for the following genera: Bellevalia (Asparagaceae), Genista (Fabaceae), Linaria (Plantaginaceae), and Teucrium (Lamiaceae).

Keywords
Cytogeography, cytotaxonomy, karyotype

How to contribute
Texts concerning new chromosome data should be submitted electronically to Lorenzo Peruzzi (lorenzo.peruzzi@unipi.it), including indications of voucher specimens and methods used.
Chromosome counts

*Bellevalia webbiana* Parl. (Asparagaceae)

**Chromosome number.** $2n = 16$ (Fig. 1)

**Voucher specimen.** ITALY. Emilia-Romagna. Località Pergola, nei terreni dell’azienda agricola Lombardi (Faenza, Ravenna); margine di bosco mesofilo nei pressi di un oliveto, 144 m, 31 March 2016, *F. Roma-Marzio*, *G. Astuti* (PI).

**Method.** Squash preparations were made on root tips obtained from cultivated bulbs. Root tips were pre-treated with 0.4% colchicine for 3 hours and then fixed in Carnoy fixative solution for 1 hour. After hydrolysis in 1N HCl at 60° C, the tips were stained in leuco-basic fuchsin. For karyotype reconstruction, four metapahasic plates were measured the KaryoType software (Altinordu et al. 2016), which was also used to match homologous chromosomes among plates and to build a mean haploid idiogram. Karyotype asymmetry was evaluated according to the parameters suggested by Peruzzi and Eroğlu (2013).

**Observations.** *Bellevalia webbiana* is a species endemic to a pre-Apennine belt between the administrative regions of Tuscany and Emilia-Romagna, where it occurs in the hills around Florence and Faenza, respectively (Gestri et al. 2010). This species is known to be tetraploid, possibly arisen from allopolyploidy (Borzatti von Loewenstern et al. 2013). However, chromosome counts were available for Tuscan populations only (Chiarugi 1949, Capineri et al. 1979, Maggini 1972) and no data for populations occurring in Romagna were reported so far. Hence, our count is the first for *B. webbiana* in this region and confirms the tetraploid asset of the species. The reconstructed karyotype (Fig. 1) and, consequently, the asymmetry indices, i.e., $CV_{CL} = 29.72$ and $M_{CA} = 31.08$, are also fully congruent with those available in the literature for Tuscan accessions (Chiarugi 1949, Maggini 1972, Borzatti von Loewenstern et al. 2013).

G. Astuti, M. Ruffini Castiglione

*Genista tenorei* G.Don (Fabaceae)

**Chromosome number.** $2n = 96$ (Fig. 2)

**Voucher specimen.** ITALY. Basilicata. Pollino Massif, Piano di Ruggio, 1 August 2016, *L. Bernardo*, *L. Peruzzi* (seeds collected in the field only; a specimen from the same locality, collected on 13 June 2013 by *L. Bernardo*, *D. Gargano*, is conserved in CLU n. 23782).

**Method.** Squash preparations were made on root tips obtained from germinating seeds. Root tips were pre-treated with 0.4% colchicine for 3 hours and then fixed in Carnoy fixative solution for 1 hour. After hydrolysis in 1N HCl at 60° C, the tips were stained in leuco-basic fuchsin.
Observations. *Genista tenorei* is endemic to Italy, limited to the Pollino Massif and belonging to the complex of *G. tinctoria* L. *Genista tenorei* is morphologically very similar to the SE European *G. depressa* M.Bieb. (Bernardo and Peruzzi 2016). This is
the first chromosome count for this species. Instead, for *G. depressa* a single $2n = 48$ count is available (Papanicolau 1984). Accordingly, our count seems to support the hypothesis of *G. tenorei* as a distinct species with respect to *G. depressa*. While $2n = 48$ is reported for several Italian localities of the related *G. tinctoria*, reports with $2n = 96$ chromosomes have also been published for this species from NW Italy (Forissier 1973, Cusma Velari et al. 2006) and Turkey (Esra et al. 2009).

F. Roma-Marzio, L. Bernardo, L. Peruzzi

*Linaria purpurea* (L.) Mill. (Plantaginaceae)

**Chromosome number.** $2n = 12$ (Fig. 3)

**Voucher specimen.** ITALY. Tuscany. Monte Calvi, (Livorno), near Villa Lanzi, 250–300 m, 22 May 2016, *D. Fontana* (seeds collected in the field only; a specimen from the same area, collected on 5 June 2010 by *L. Peruzzi*, *G. Gestri*, *B. Pierini*, *V. Lazzeri*, is conserved in PI).

**Method.** Squash preparations were made on root tips obtained from germinating seeds. Root tips were pre-treated with 0.4% colchicine for 3 hours and then fixed in Carnoy fixative solution for 1 hour. After hydrolysis in 1N HCl at 60° C, the tips were stained in leuco-basic fuchsin.

**Observations.** *Linaria purpurea* is an endemic Italian species ranging from Emilia-Romagna to Calabria and Sicily (Peruzzi et al. 2014). Our chromosome count is the first from Tuscany and is in accord with all the previous counts derived from populations occurring in Sicily, Calabria and Umbria (Bedini et al. 2010 onwards).

A. Carta, M. D’Antraccoli, F. Roma-Marzio

*Teucrium flavum* L. subsp. *flavum* (Lamiaceae)

**Chromosome number.** $2n = 32$ (Fig. 4)

**Method.** Squash preparations were made on root tips obtained from germinating seeds. Root tips were pre-treated with 0.4% colchicine for 3 hours and then fixed in Carnoy fixative solution for 1 hour. After hydrolysis in 1N HCl at 60° C, the tips were stained in leuco-basic fuchsin.

**Observations.** *Teucrium flavum* is an evergreen woody shrub whose range extends over the entire Mediterranean Basin, from the eastern coasts of Spain to Turkey (Lakušić et al. 2006). *Teucrium flavum* belongs to *T.* sect. *Chamaedrys* (Mill.) Schreb., including four subspecific taxa (Euro+Med 2006 onwards). The species within that section show
different chromosome numbers, ranging from $2n = 28$ to $2n = 96$ (Özcan et al. 2015). However, all the previous counts for *T. flavum* report $2n = 32$ (Rice et al. 2014, Özcan et al. 2015). In Italy, only two counts are currently known, from populations occurring in Sicily and Latium (Bedini et al. 2010 onwards). Our count is the first for Tuscany and confirms the only known chromosome number reported for the species.

F. Roma-Marzio

**Acknowledgements**

The authors gratefully acknowledge the financial support by “Progetto di Ricerca di Ateneo” (PRA) of the University of Pisa, grant number PRA_2016_1, for the chromosome count of *Bellevalia webbiana*.
